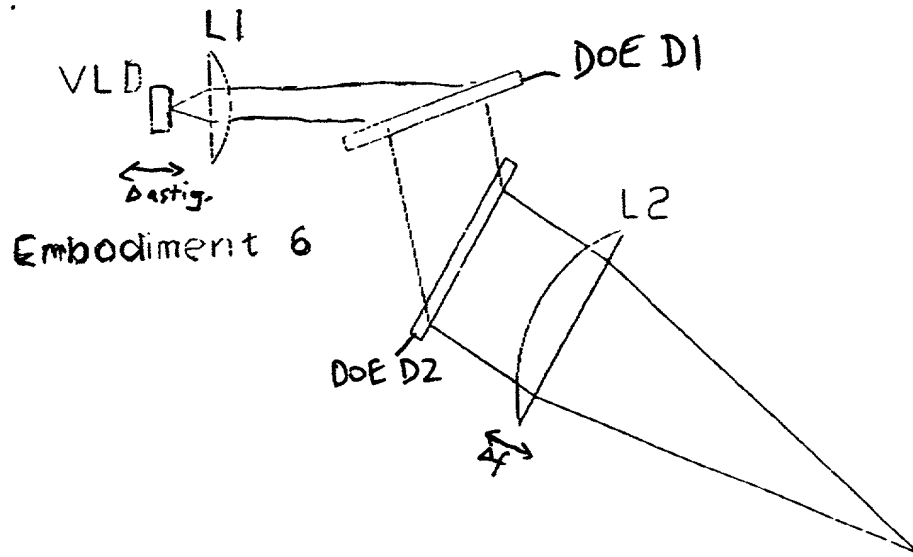

FIG. 2f

~~Embodiment~~

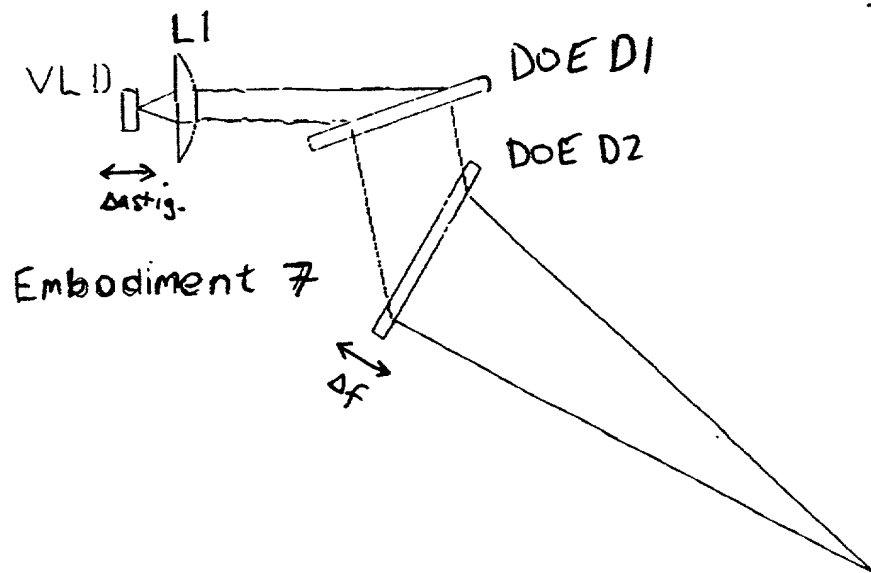

FIG. 2g

Embodiment 8

The diagram shows an optical system with the following components and labels:

- VLD**: Variable Length Drive, represented by a small rectangle.
- L1**: A lens element.
- DoE D1**: A Deformable Optical Element, represented by a tilted rectangular plate.
- DoE D2**: A second Deformable Optical Element, represented by another tilted rectangular plate.
- L2**: A second lens element.
- Δx₁** and **Δx₂**: Indicators for the deformation or displacement of the DoE elements.
- Δx₃**: An indicator for the displacement of the final lens element L2.
- Astig.**: A double-headed arrow indicating astigmatism.

FIG. 2H

The diagram shows an optical system labeled "Embodiment 9". It includes an "Incident" beam entering from the left, a "VLB" (Variable Length Beam) component, a lens "L1", a "DOE D1" (Diffraction Order Element) component, a second lens "L2", and a "DOE D2" component. A distance Δa_{sig} is indicated between the VLB and L1. A distance Δf is indicated between L2 and DOE D2. The beam is shown converging and then diverging after the second DOE.

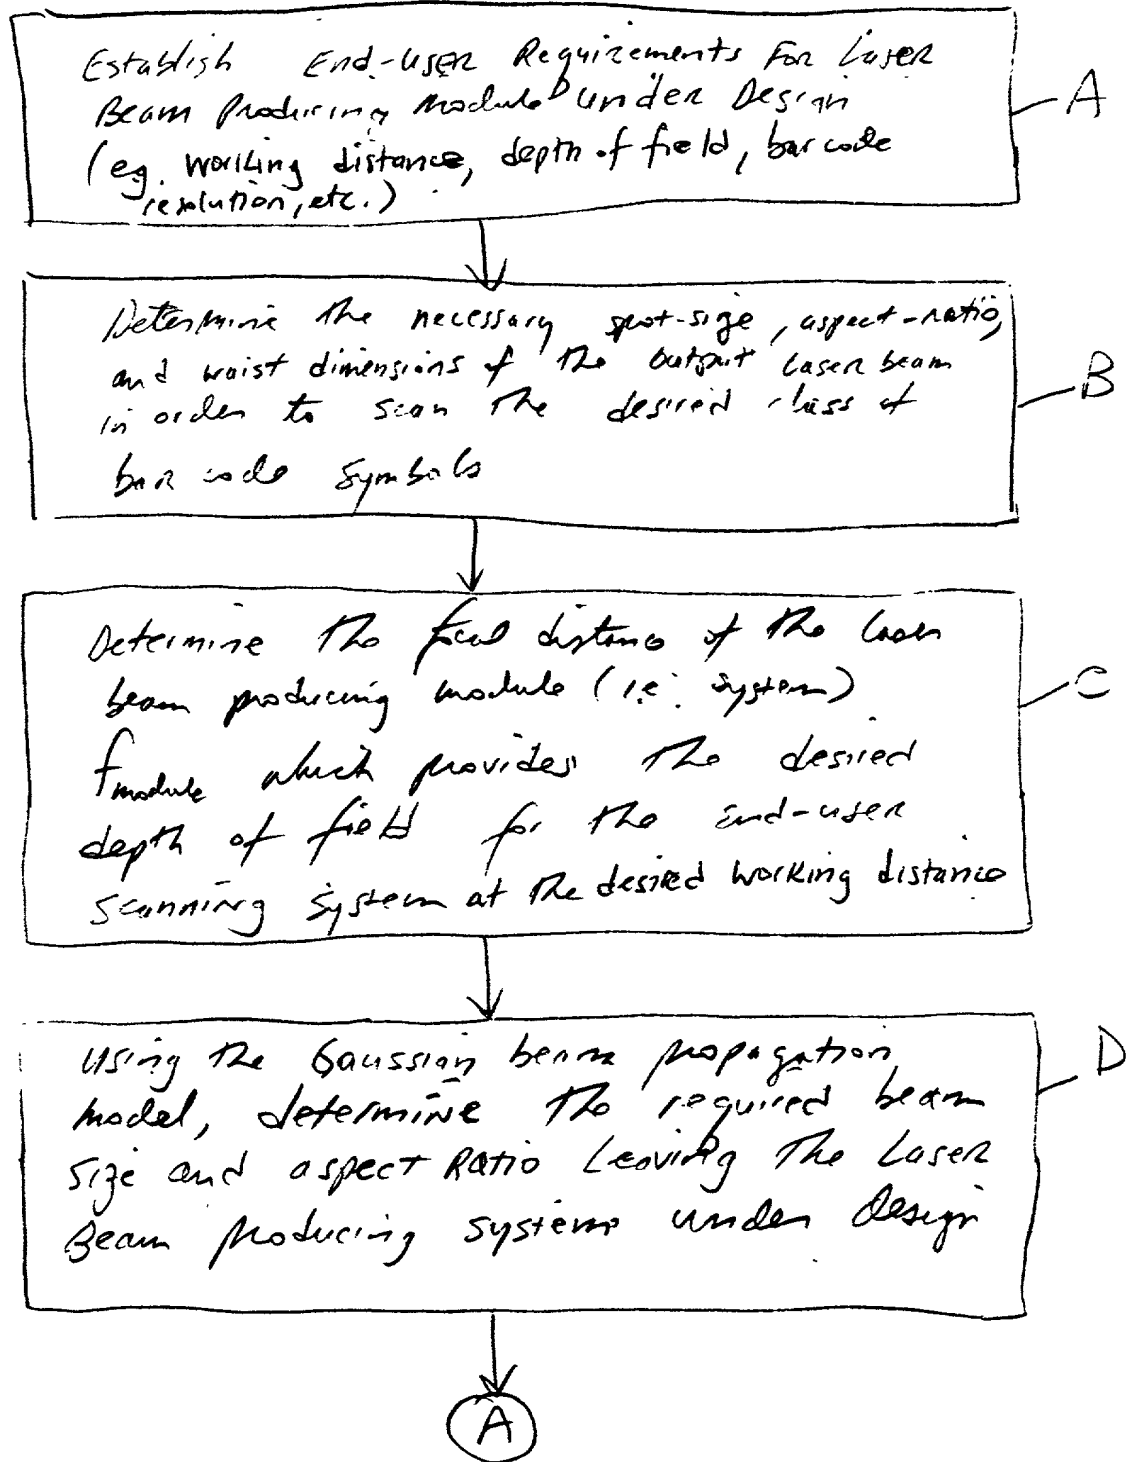

FIG. 3A1

A

Choose a laser source (eg VLO) having acceptable beam characteristics and an acceptable amount of beam astigmatism

-E

Determine an appropriate value for the Beam Shaping Factor of the HOE-based Laser beam modifying subsystem (i.e. DOE_D and DOE_{DZ}) in order that the aspect-ratio of the laser beam entering the subsystem will leave the subsystem with the aspect-ratio determined at block D.

F

use the Beam shaping Factor determined at Block F to determine the HOE instruction parameters $(\Theta_{01}, \Theta_{R1}, \Theta_{02}, \Theta_{R2}, p)$ expressed at Reconstruction wavelength λ_R for DOE's D1 and D2, so that the output beam has zero net dispersion and the desired aspect ratios determined at Block B

LG

FIG 3A2

12/59

(B)

determine the distance from the VLD to first lens element L1 which produces an output laser beam having the desired beam size determined at Block D

H

determine the focal length of lens element L1 that produces an output laser beam having the desired focal length determined at Block C

I

FIG 3A3

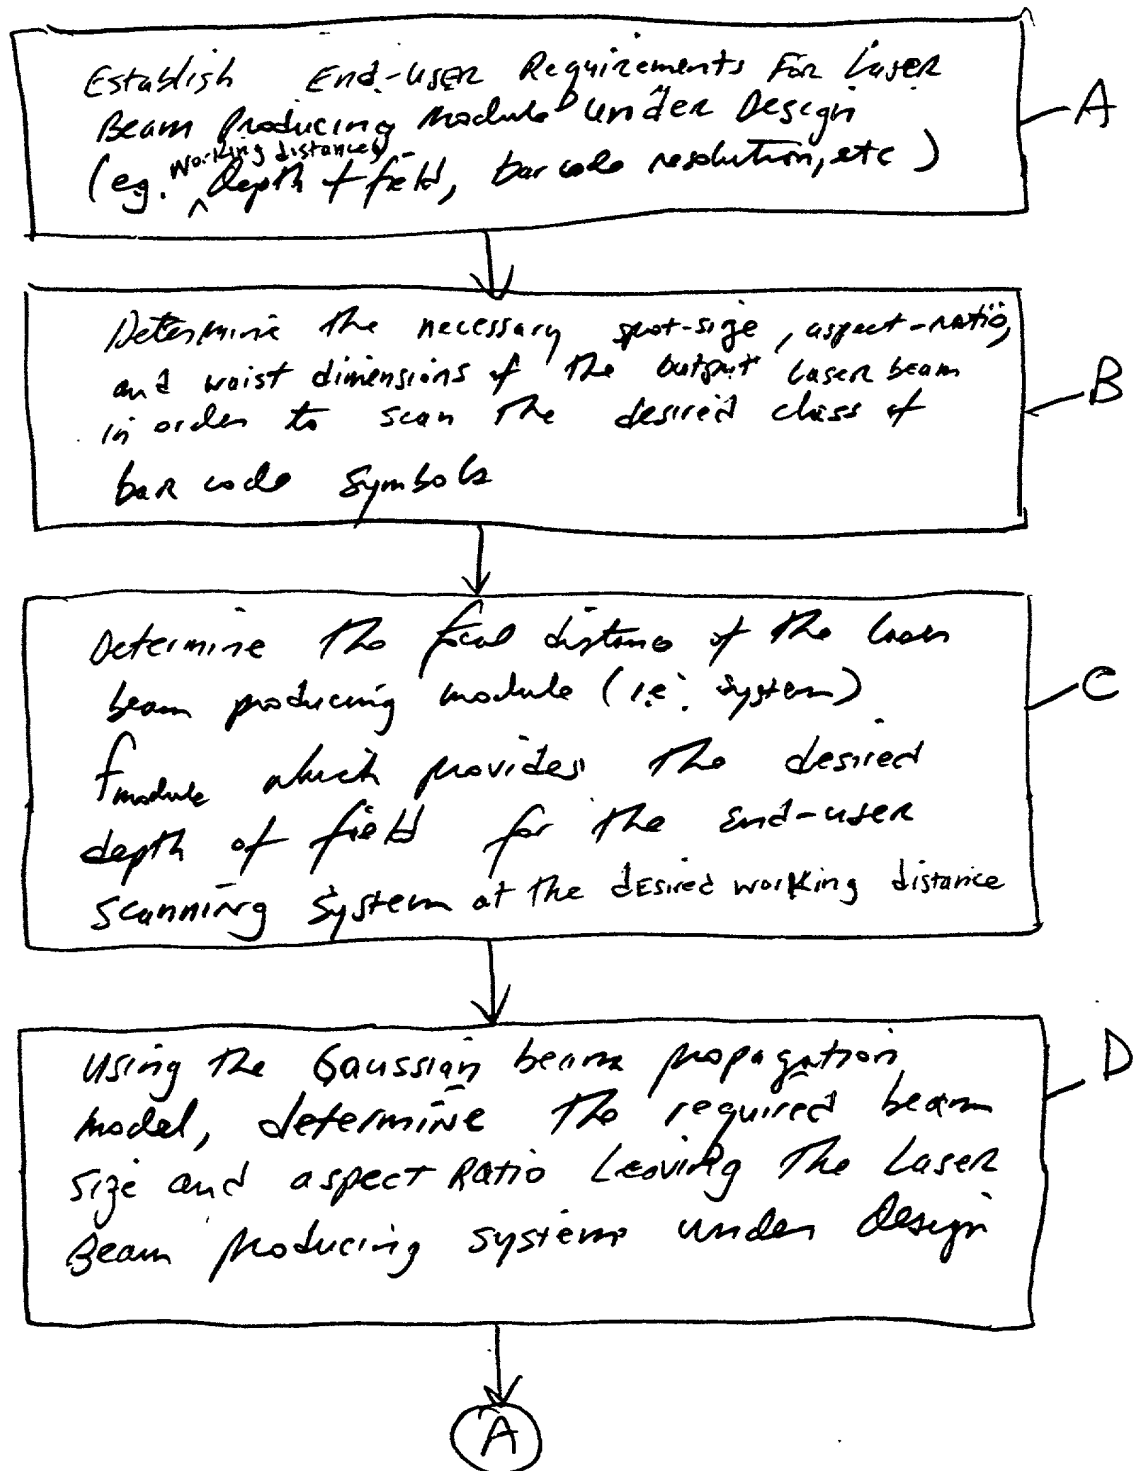

FIG. 3B1

14/59

(A)

Choose a laser source (eg. VLO) having acceptable beam characteristics and an acceptable amount of beam astigmatism

E

Determine an appropriate value for the Beam Shaping Factor of the HOE-based laser beam modifying subsystem (ie. HOEs H1 + H2) in order that the aspect ratio of the laser beam entering the subsystem will leave the subsystem with the aspect ratio determined at Block D.

F

use the Beam Shaping Factor determined at Block F to determine the HOE construction parameters ($\theta_{01}, \theta_{R1}, \theta_{02}, \theta_{R2}, P$) separated at reconstruction wavelength λ_R for HOEs H1 and H2, so that the output laser beam has zero net dispersion and the desired aspect ratio determined at Block B

G

(B)

15/59

determine the distance from the VLD to first lens element L1 which produces an output laser beam having the desired beam size determined at Block D

Determine which optical component of the system will converge/diverge the laser beam from the VLD so that upon adjusting the separation between the VLD and lens L1, the convergence or divergence of the non-collimated laser beam entering the DOE-based subsystem cancels out the inherent astigmatism in the beam produced by inherent characteristics of the VLD.

Determine the optical parameters in the laser beam producing system under design to yield the desired focal distance in the output laser beam determined at Block C

FIG. 3B3

(B)

10/59

determine the distance from the VLD to first lens element L1 which produces an output laser beam having the desired beam size determined at Block A

determine the focal length of lens L1 so that, when the correct amount of separation exists between the VLD and lens L1, the resulting convergence/divergence of the laser beam will eliminate astigmatism upon passing through DOE D1 only.

Assume HOE H2 is a stigmatic-type optical element and determine the focal length of lens L2 so that desired average focal length is achieved in output laser beam

determine construction of DOE D2 to produce desired focal length through lens L2

FIG 3C3

09965123-092701

ESTABLISH END-USER Requirements for the laser beam producing module under design (e.g. final aspect-ratio and spot size)

Use the Gaussian beam propagation model to determine the required beam aspect-ratio leaving the laser beam producing system in order to produce the specified aspect-ratio at focus

Choose an acceptable laser source (eg. VLD) having an acceptable degree of beam divergence, astigmatism, aspect-ratio, wavelength and bandwidth

determine an appropriate value for the beam-shaping factors of the DOE's D1 and D2 which ensures that the aspect-ratio of the beam entering the laser beam modifying subsystem is sufficiently modified so that the output laser beam has the desired aspect-ratio.

FIG. 3D1

20/59

(A)

determine the construction angles $\Theta_{i1}, \Theta_{d1}, \Theta_{i2}, \Theta_{d2}, p$ expressed at reconstruction wavelength λ_r for the two DOEs D1 and D2 which provides an optical subsystem wherein the laser beam output from the second DOE D2 thereof has (1) effectively zero net beam dispersion, and (2) The desired aspect-ratio determined at Block B

E

determine the convergence of the beam leaving lens L1 that will adjust or eliminate the astigmatism produced by the VLD

F

Use the Gaussian beam propagation model to determine the required beam spot size leaving the laser beam producing system in order to produce the focused spot size determined at Block A

G

determine the distance from the VLD to the first lens element L1 that produces an output laser beam having the desired beam size determined at Block G

H

(B)

09065123.092701

21/59

determine the focal length of lens
element L1 that produces a beam
with the convergence determined in
Block F
